

Backend Tasks

1. Create a Node.js Server:

- Use Express.js to set up a basic server.
- Set up routes for handling different API endpoints.

2. Database Setup:

- Use MongoDB for storing application data.
- Set up Mongoose models for storing information related to the assessment tasks.

3. API Endpoints:

- Create API endpoints for CRUD (Create, Read, Update, Delete) operations related to the internship assessment tasks.

4. User Authentication:

- Implement user registration and login functionality using JWT (JSON Web Tokens).
- Ensure secure handling of passwords and tokens.

5. Form Handling:

- Create endpoints to handle form submissions from the landing page, such as contact forms or assessment submissions.
- Validate and sanitize incoming data before storing it in the database.
